

# Cost of producing outdoor power supply

What is the cost structure of electricity generation technologies?

Cost structure of generation technologies. Electricity generation technologies vary dramatically in their cost structure. Some plants, such as nuclear, wind and solar power, have virtually zero variable costs: once they are built, they produce electricity virtually for free. This is in stark contrast to fossil fuel-based power plants.

What is the least cost option for a power plant?

For example in Figure 5, if a power plant is meant to be used 2,000 hours per year or less, the least-cost option is a natural gas-fired power plant. If it is used more than 2,000 hours but less than 8,000 hours, the least cost option is a coal-fired power plant.

How much does a hybrid power system cost?

If you are curious about the cost, a base hybrid system that can generate 7.5 kWh per day starts at around \$35,000 and can go up to \$65,000 for a system that generates 15.5 kWh per day. Being able to harness power off the grid gives you freedom. It also enables you to be less reliant on outside sources.

How do you calculate long-term profit of a power plant?

Short-term profit. Sometimes called the "contribution margin" or "gross profit" of a power plant, this is calculated as the total revenue earned by a power plant minus variable costs of generation. In other words, fixed costs are not accounted for. Long-term profit. This is equal to total revenue minus total cost, including fixed costs.

What are fixed costs in a power plant?

Fixed costs are the cost of equipment, land, financing, project management, grid connection, and construction of the power plant. These are usually expressed per unit of installed capacity (per kW or per MW). Fixed costs are regarded as "sunk costs", because once the plant is erected and fixed costs are incurred they cannot be recuperated.

How much does it cost to build a power station in Germany?

Block 5 of Irsching Power Station in Southern Germany uses natural gas as fuel in a combined cycle, converting 1,750 megawatts of thermal energy to 847 net MW of usable electricity. It cost EUR450 million to build. This works out to some EUR531 per kW of capacity.
