What happens if you charge a battery with an unregulated supply?

If you are charging it with a 24v unregulated supply, the battery will overheat, burn up, and possibly explode. If you charge it with an over-voltage and current-limited supply, the battery will be charged to 12v and the extra energy will be dissipated as heat in the supply regulators.

Does a 12V battery keep a battery warm?

These results will be obtained regardless of what causes the "excess energy" on the grid (lightning, solar installations, wind power, etc.). For the last two questions, if you are charging a 12v battery with a 13v source, the extra 1v will keep the battery "warm" after it is charged to 12v.

What happens if voltage is too high?

If the voltage in the sockets of your house is too high it might break the power electronics of your devices (PC's, TV, etc..) if the voltage is too low, electronic devices might not work or even break as well. An incandescent light bulb shines brighter on high voltage, and less bright on lower voltage. Tell me if more details are needed.

What happens if there is too much supply?

Too much demand/too little supply) will drop the voltage and frequency on the grid from its usual spot of 50hz/60hz/whatever your country's mains is. Conversely, too much supply/too little demand will increase frequency. A small amount of frequency deviation is not a significant problem.

What happens if Photovoltaik produces more power than consumed?

If now a lot of Photovoltaik produces more power than consumed in this area, the Power has to go into the grid over the transformator. But yet, the current flows towards the transformer, which means, that it is the point with the lowest, not the highest voltage.
